(57) Abstract :

The present invention relates to the development of predictive QSPR models by correlating the physicochemical properties of varying grades of cellulose ethers (Hydroxypropylmethylcellulose, HPMC) with those of Nateglinide (NTG) containing tablets (in-vitro and in-vivo properties). This led to the generation of several QSPR models, out of which a model with a high coefficient of determination and significant impact of the individual descriptor on the formulation property was selected as the best predictive model for the desired property. The predictability of developed QSPR models was subsequently validated by an accurate external validation method. In-vivo studies showed limited absorption of the NTG. Developed QSPR models showed promising validated predictability for formulation characteristics. The applicability of present work in formulation development could significantly reduce the time and cost expenditure on design trials without actually formulating a delivery system.
